

8. Integrated site studies

Many different research lines, research strategies or analytical techniques that are considered part of the disciplines: Archaeometry, Bio-Archaeology, Geo-Archaeology, Pure Archaeology (including excavation strategies and cultural or behavioural interpretations), may be applied in combination to contribute to the overall reconstruction of the economy, the society organisation or the environment of an archaeological site. This session offers a forum to present such integrated research, by Archaeologists or Scientists putting special emphasis on studies transgressing the individual material, technique or discipline, but offering an insight in the research performed on a site as a whole.
